Summary

Senior iOS Engineer with 10+ years of experience in consumer apps, including freelance and contract work. At Birmarket, a marketplace with 2M+ customers, developed Premium Subscription on iOS and later rebuilt it as an SDK shipped in three apps. Built the Drinkit coffee-ordering app from scratch with two other iOS engineers, and owned the Apple Watch app for a voice AI assistant.

Skills

iOS: Swift, SwiftUI, UIKit, Objective-C, Swift Concurrency (async/await), Combine, MVVM, Clean Architecture, Modular Architecture, SDK Development, REST APIs, Performance Optimization

Apple frameworks: StoreKit 2, CloudKit, Core Data, WidgetKit, App Intents, Live Activities, CarPlay, watchOS, MapKit, Core Location, Apple Foundation Models

Testing, CI/CD & Release: XCTest, Swift Testing, Unit Testing, Integration Testing, Xcode Instruments, CI/CD, GitLab CI, Bitrise, GitHub Actions, TestFlight, App Store Connect, A/B Testing, Feature Flags, Firebase, PostHog

Agentic development: Claude Code, Codex

Experience

Senior iOS Engineer | GlobalLogic (contract) | Kyiv, Remote | Jan 2026 - Jul 2026

AI voice assistant on Apple Watch

A hands-free Apple Watch assistant for field workers, delivered to the customer's executives as a TestFlight build at the end of the six-month contract. Owned the watch app and its iPhone relay end to end in a team of seven, with product, analysts, design and the AI team.

- Built the voice interface on the watch and mapped structured LLM responses to on-screen actions, alerts, and haptics.
- Developed work-site maps for the watch with hazard areas and compass-guided navigation, plus arrival detection on the iPhone.
- Designed and implemented the emergency flow on watchOS.
- Implemented real-time audio streaming between the watch and the AI backend through an iPhone relay.

Voice AI, Structured Outputs, SwiftUI, WatchKit, WatchConnectivity, WebSockets

Senior iOS Engineer | Competo (Birmarket) | Kyiv, Remote | Apr 2022 - Jan 2026

Birmarket | E-commerce marketplace

Birmarket started as Umico and grew to 2M+ customers. On the Loyalty team, grew Premium Subscription from a single feature into a full module.

- Built marketplace features across the app in UIKit and SwiftUI, including deep-link navigation, and migrated 15+ screens from UIKit to SwiftUI.
- Carried about seven of the 30+ modules out of the monolith into Swift packages, and fixed memory leaks and UI hangs in the legacy code.
- Rebuilt Premium Subscription as a SwiftUI and Clean Architecture SDK, shipped in Birmarket, the Birbank banking app and the M10 wallet. Raised its unit-test coverage from about 15% to 80%.
- Planned the migration: backlog, acceptance criteria and API boundaries with backend and other teams.

- When the SDK's Firebase events overwrote the host apps' analytics, proposed PostHog as the SDK's own analytics and validated it on two host apps before the rollout.
- Replaced a long subscription page, where most users scrolled to the end but few subscribed, with a slide-based onboarding. A/B tests cut it down from five screens to three, and conversion among users who opened it rose to about 7-8%.
- Onboarded two iOS engineers into the loyalty codebase, covering its architecture and code review. Wrote the subscription SDK documentation and handed the SDK over to a new developer.
- Took Crashlytics on-call shifts for an app that stayed above 99.9% crash-free, and fixed loyalty-area crashes, including profile-editing crashes after a breaking backend change.

SwiftUI, UIKit, Combine, Swift Concurrency (async/await), Swift Package Manager (SPM), SDK Development, Clean Architecture, MVVM, CI/CD, Integration Testing, A/B Testing, PostHog, APNs

Senior iOS Engineer | Drinkit | Kyiv, Remote | Feb 2020 - Feb 2022

Drinkit app | Digital-first coffee brand

Drinkit is an app-first coffee brand, now with 250+ coffee shops. One of three iOS engineers, alongside two Android engineers, who built the Drinkit app from scratch.

- Shipped the menu, ordering and pickup flows in UIKit for the first coffee shop's launch. Kept developing the app, which handled about 95% of orders, as the chain grew to eight shops.
- Built much of the drink customization, including client-side price calculations, and worked with the designer on a simpler flow that relied less on a long list of options.
- Owned the dynamic menu, the app's signature feature: client-side logic that built each customer's menu from the backend catalog by preference and time of day, with looping drink videos cached offline.
- Ran App Store releases, set up the release CI pipeline, and wrote unit tests for pricing and cart state.

Swift, UIKit, AVFoundation, Unit Testing, GitLab CI, A/B Testing

Senior iOS Engineer | SOLVVE | Kyiv, On-site | Jul 2018 - Feb 2020

PLAYHERA | Esports tournament platform

PLAYHERA was an international esports platform for organizing online tournaments. Developed features for the existing iOS app on the product team.

- Built tournament standings, player profiles and the news feed in UIKit, and reviewed teammates' code.

Swift, UIKit, Code Review

iOS Developer | GBKSoft | Kyiv | Jun 2017 - Jun 2018

Clovis, Eastern Union, Bluetooth trackers, and an offline game

Clovis was the e-commerce store of a US sports-nutrition business, and Eastern Union was a commercial real-estate app. The work also covered an offline game and Bluetooth tracker R&D. Worked on the product teams and was the primary developer of the Clovis storefront.

Swift, SnapKit, CoreBluetooth

Own apps, built with AI coding agents

DriveCheckUA | App Store. Air raid alerts for drivers on iPhone and CarPlay, built in Swift 6 with an on-device Foundation Models summary, widgets, a Live Activity and a StoreKit 2 subscription flow.

OneCart Family | App Store. A family shopping list built on Core Data and synced through private and shared CloudKit stores with CKShare invitations. Includes widgets and App Intents.
