Max Vilchevskiy

Senior iOS / Product Engineer | Swift, SwiftUI, UIKit

Kyiv, Ukraine

vil4max@gmail.com | linkedin.com/in/vil4max | github.com/vil4max | vil4max.com | t.me/vil4max

Summary

Senior iOS / Product Engineer with 10+ years of experience in consumer apps. Owned Premium Subscription on iOS for a marketplace with 2M+ customers, rebuilt it as an SDK shipped in three apps, and built and A/B-tested the onboarding that raised new-subscriber conversion.

Skills

iOS: Swift, SwiftUI, UIKit, Objective-C, Swift Concurrency (async/await), Combine, MVVM, Clean Architecture, Modular Architecture, SDK Development, REST APIs, Performance Optimization

Apple frameworks: StoreKit 2, CloudKit, Core Data, WidgetKit, App Intents, Live Activities, CarPlay, watchOS, MapKit, Core Location, Apple Foundation Models

Testing, CI/CD & Release: XCTest, Swift Testing, Unit Testing, Integration Testing, Xcode Instruments, CI/CD, GitLab CI, Bitrise, GitHub Actions, TestFlight, App Store Connect, A/B Testing, Feature Flags, Firebase, PostHog

Agentic development: Claude Code, Codex

Experience

Senior iOS Engineer | GlobalLogic (contract) | Kyiv, Remote | Jan 2026 - Aug 2026

AI voice assistant on Apple Watch

A hands-free Apple Watch assistant that let field workers report status and ask questions by voice, delivered to the customer's executives as a TestFlight build. Owned the watch app end to end.

- Built the voice interface on the watch and mapped structured LLM responses to on-screen actions, alerts, and haptics.
- Developed work-site maps for the watch with hazard areas and compass-guided navigation, plus arrival detection on the iPhone.
- Designed and implemented the emergency flow on watchOS.
- Implemented real-time audio streaming between the watch and the AI backend through an iPhone relay.

Voice AI, Structured Outputs, SwiftUI, WatchKit, WatchConnectivity, WebSockets

Senior iOS Engineer | Competo (Birmarket) | Kyiv, Remote | Apr 2022 - Jan 2026

Birmarket | Online marketplace

Birmarket started as Umico and grew to 2M+ customers. On the Loyalty team, built Premium Subscription and expanded it from a single feature into a full module.

- Built marketplace features across the app in UIKit and SwiftUI, including deep-link navigation, and migrated 15+ screens from UIKit to SwiftUI.
- Extracted feature modules and shared infrastructure into Swift packages as the team modularized the monolith, and fixed performance issues in the legacy code: memory leaks from retain cycles and UI hangs.
- Rebuilt Premium Subscription as a SwiftUI and Clean Architecture SDK, shipped in a marketplace, a banking app, and a payment wallet. Raised its unit-test coverage from about 15% to 80%.
- When the SDK's Firebase events overwrote the host apps' analytics, proposed PostHog as the SDK's own analytics and validated it on two host apps before the rollout.

- Analytics showed few users reached the subscribe button on the long subscription page. Replaced the page with a slide-based onboarding and A/B-tested it down from five screens to three, which raised new-subscriber conversion.
- Onboarded two iOS engineers into the loyalty codebase, covering its architecture and code review. Wrote the subscription SDK documentation and handed the SDK over to a new developer.
- Took on-call crash-monitoring shifts (crash-free rate above 99.9%) and helped the team keep profile editing working for users through a breaking backend change.

SwiftUI, UIKit, Combine, Swift Concurrency (async/await), Swift Package Manager (SPM), SDK Development, Clean Architecture, MVVM, CI/CD, Integration Testing, A/B Testing, PostHog, APNs

Senior iOS Engineer | Drinkit | Kyiv, Remote | Feb 2020 - Feb 2022

Drinkit app | Digital-first coffee brand

Drinkit is an app-first coffee brand, now with 250+ coffee shops. Brought an existing mobile team into Drinkit and built the iOS app with it from scratch alongside product, design, and backend.

- Shipped the menu, ordering, and pickup flows in UIKit for the first coffee shop's launch. Kept developing the app, which handled nearly all orders, as the chain grew to eight shops.
- Built much of the drink customization, including client-side price calculations, and worked with the designer on a simpler flow that relied less on a long list of options.
- Owned the dynamic menu, the app's signature feature: client-side logic that built each customer's menu from the backend catalog by preference and time of day, with looping drink videos cached offline.
- Ran App Store releases, set up the release CI pipeline, and wrote unit tests for pricing and cart state.

Swift, UIKit, GCD, MVP (Model-View-Presenter), AVFoundation, Payment SDK Integration, Unit Testing, GitLab CI, A/B Testing

Senior iOS Engineer | SOLVVE | Kyiv, On-site | Jul 2018 - Feb 2020

PLAYHERA | Esports tournament platform

PLAYHERA was an international esports platform for organizing online tournaments. Developed features for the existing iOS app on the product team.

- Added tournament-management features in UIKit within the app's feature-module architecture.
- Reviewed teammates' code and contributed to App Store releases.

Swift, UIKit, Auto Layout, Code Review

iOS Developer | GBKSoft | Kyiv | Jun 2017 - Jun 2018

Clovis, Eastern Union, Bluetooth trackers, and an offline game

Clovis was the online store of a US sports-nutrition business, and Eastern Union was a commercial real-estate app. It also included an offline game and Bluetooth tracker R&D. Worked on the product teams and was the primary developer of the Clovis storefront.

- Clovis: product browsing, sign-in, and purchasing, with later App Store updates.
- Bluetooth trackers: configured the prototypes, measured their behavior, and debugged the device integration.
- Eastern Union: turned domain rules into screen behavior and information structure. Defend Ukraine: added local difficulty levels to the offline game.

Swift, SnapKit, CoreBluetooth
